Yacht News Türkiye's 58th issue turns its focus to Türkiye's steadily deepening expertise in the refit sector. The growing technical capacity across the industry's various production and maintenance hubs is explored not only through projects, but also through data, field observations, and production practices placing the subject within a broader and more meaningful context.

At the heart of this approach is the special feature titled "From Bodrum to Antalya, from Yalova to Tuzla: Türkiye's Refit Expertise Gains Prominence on the Global Map." Examining Türkiye's refit ecosystem through the lenses of infrastructure strength, craftsmanship quality, and project diversity, the feature presents a comprehensive framework that makes the industry's accumulated know-how visible. Beyond outlining the current landscape, it also serves as a strong reference point for understanding Türkiye's positioning on a global scale.

With this issue, Yacht News Türkiye once again clarifies its editorial direction: a publishing approach that goes beyond surface-level, showcase-driven narratives in favor of data-driven, field-informed storytelling. This perspective transforms the magazine from a passive observer into a platform that documents and interprets the real agenda of the industry.

In the Craftsmanship & Innovation section, the Petra SF-39 by Hercon Yachting stands out as a refined product of engineering discipline. Bringing together performance, durability, and functionality within a single framework, the model reflects the brand's production culture built over the years. More than just a model, the Petra SF-39 is presented as a tangible expression of an engineering philosophy that evolves through continuity.

The Bulletin section captures attention with its dense agenda of current topics. Industry developments, investments, and deliveries are brought together in a concise yet effective structure, creating a strong content flow that reflects the dynamic nature of the maritime world.

In Voices of Industry, perspectives and experiences from different layers of the sector come together. Interviews with Özcan Savaş, Seapower Sales Manager; Sinan Aytekin, CEO of Asmarina; and Bora Dinc and Dincer Dinc, founders of Naval Yachts, offer a direct and authentic view of the industry, spanning from production to management. This section not only reflects its title, but truly lives up to it.

In Exhibitions, we focus on the industry's key meeting points. From Boot Düsseldorf where Yacht News Türkiye is featured with a special edition to the Bosphorus Boat Show and the upcoming 7th TYBA Yacht Charter Show, this trajectory highlights the sector's international connections and commercial dynamism.

With all its content, this issue stands as a threshold-offering readers the opportunity to reassess Türkiye's production strength and depth of expertise in the yachting industry.

Enjoy the read.

With kind regards,

Meral ER

From Bodrum to Antalya, from Yalova to Tuzla: Türkiye's Refit Expertise Gains Global Visibility

Special Feature by

Aslı SAĞBİLGE

In the superyacht industry, refit goes far beyond routine maintenance; it represents a strategic asset management phase that redefines a yacht's lifecycle. From hybrid system modernizations and hull extension projects to technically advanced upgrades requiring sophisticated engineering and refined interior redesigns, refit has emerged as one of the most dynamic and high value-creating segments of the global yachting industry.

Across the Mediterranean basin, different regions distinguish themselves through their own areas of expertise. Italy continues to set benchmarks in design aesthetics. Spain in operational scale, and Northern Europe in highly specialized engineering capabilities. Türkiye, as a rising force in the Eastern Mediterranean, offers a distinctive integrated refit approach by blending its long-standing craftsmanship tradition with modern engineering infrastructure. This model brings together all stages of the process—from steel and aluminum workmanship to complex system integration—under the management of a single facility, enabling projects to benefit from greater flexibility and faster implementation.

The extensive network of shipyards stretching from Tuzla to Bodrum and from Yalova to the Antalya Free Zone illustrates how this transformation takes shape through specialized expertise in each hub. With the diversification of refit projects in recent years, this network has become increasingly visible, demonstrating the wide technical spectrum of Türkiye's refit capabilities—from hull renewals and interior modernizations to system upgrades and comprehensive transformation projects. The transfer of shipbuilding experience into refit operations remains one of the defining characteristics of this ecosystem.

This special feature brings together the technical capabilities and project approaches of shipyards operating in Türkiye's refit sector, while also serving as an editorial reference study prepared with insights gathered directly from the field. These centers, operating across different regions of Türkiye, present a current and comprehensive panorama of the country's evolving refit ecosystem through their areas of expertise, infrastructure capacities, and project experience.

A Heritage of Yacht Building

Refined Engineering, Master Craftsmanship

Heng Yay combines the deep-rooted heritage of Turkish yacht building with a refined engineering discipline under the reviva brand. The shipyard's refit philosophy goes far beyond a standard repair process; each project is approached as an engineering craft, carefully preserving the yacht's original DNA while introducing technically sophisticated improvements. Technological integrations carried out without disturbing the interior's authentic character, along with structural transformations requiring advanced craftsmanship, form reviva's technical signature in rich refit projects.

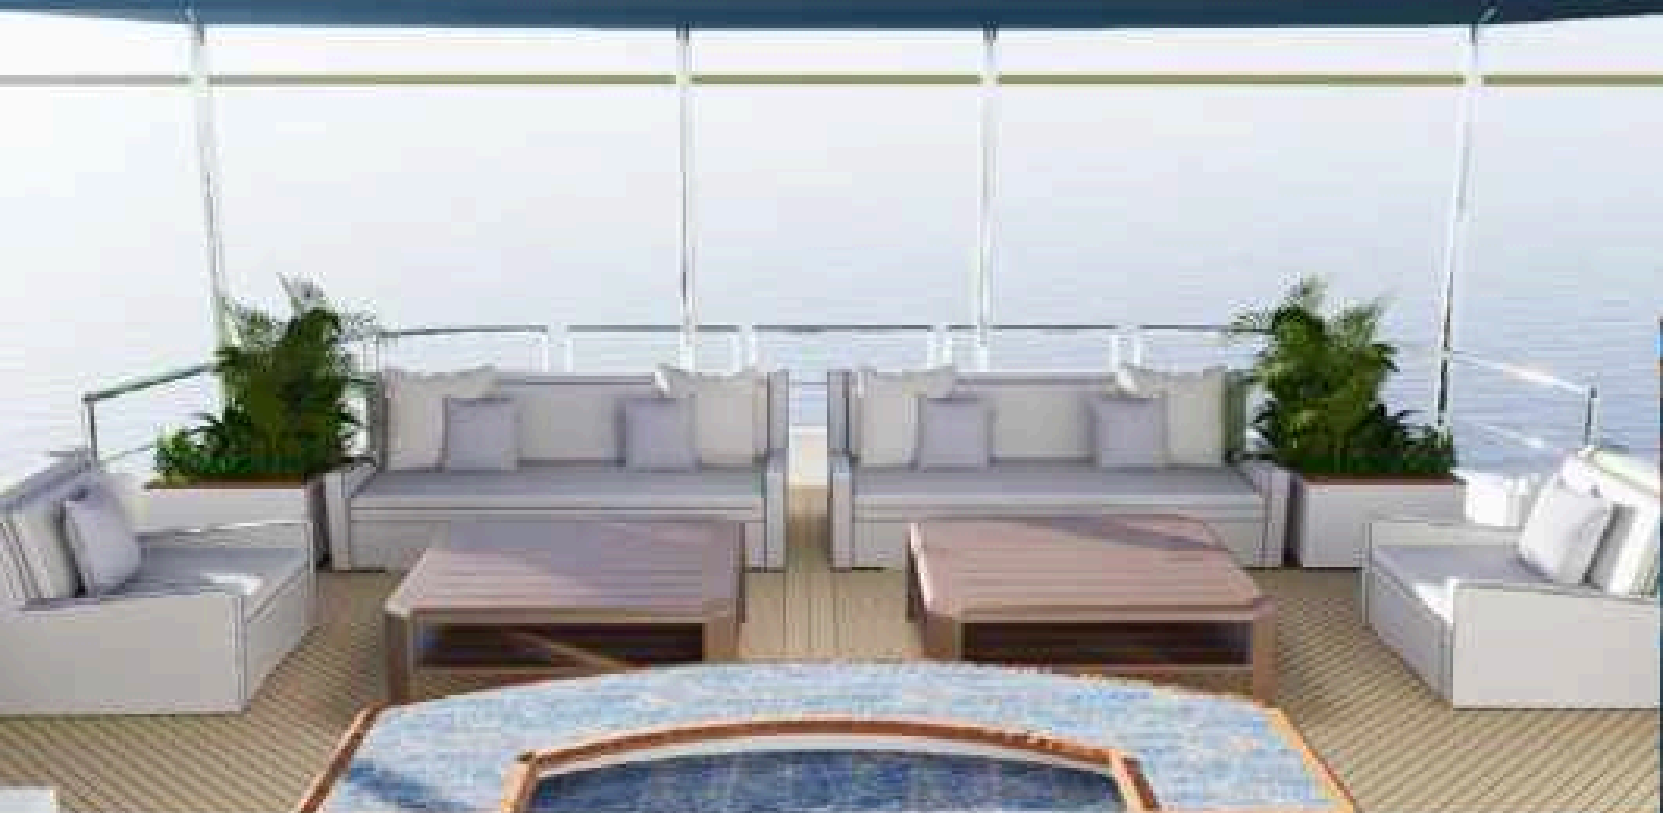

REVIVA REFIT

R15 Project

(M/Y Mirabella - Full Transformation)

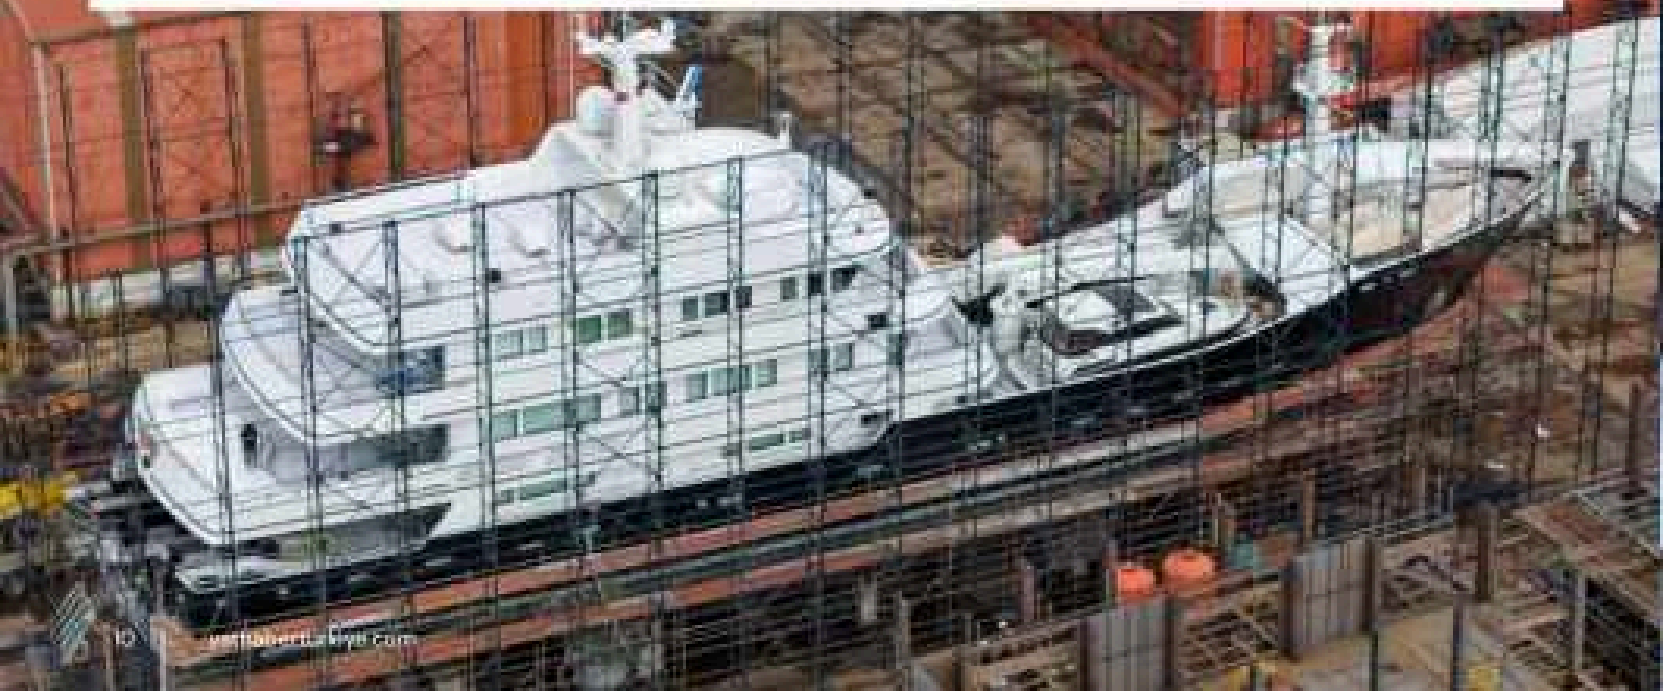

Mirabella reflects reviva's restoration capabilities and mastery of fine wood craftsmanship. The process began with the re-upholstering of all interior furniture and wooden surfaces (restoration of "redig" varnish finishes), followed by modernization of electrical, electronic, and lighting systems. In addition to the complete repainting of the hull and superstructure, exterior living spaces were redesigned with a new jacuzzi installation and bespoke spa solutions. A transformer system integrated into the swimming platform and structural revisions were implemented to meet modern onboard equipment expectations.

R11.4 Project

(Grand Rusalina
60m Superyacht
Maintenance)

Precision in large-scale projects. The work carried out on Grand Rusalina reflects Hengli Yoy's meticulous approach to mechanical maintenance and the five-year RINA class survey. In addition to comprehensive mechanical revisions of engine systems, auxiliary machinery, and critical components, extensive valve maintenance was conducted across all systems. A full repaint of the hull, renewal of exterior upholstery, and improvements to interior areas (cabins and salon) elevated both the aesthetic and technical integrity of the yacht.

In the critical technical infrastructure of refit processes, the Serenity II project highlights Mengi Yag's engineering precision. Technically demanding procedures such as the complete renewal of wastewater units and piping systems demonstrate the shipyard's commitment to fundamental engineering principles. Completed with RINA approvals and certification processes, the project underscores Mengi Yag's focus on functionality in every detail.

R16 Project

(BT21 - Hull Extension and Reconstruction)

A meeting point of engineering and structural craftsmanship. The shipyard extended the 38-meter yacht by two meters, bringing it to 40 meters while improving stability and optimizing the vertical center of gravity (VCG). The area previously used as a sound and fitness space has been transformed into a technical garage housing a Williams 520 tender and two jet skis. A newly integrated shell door on the starboard side and a ceiling crane modernize the transfer of tenders and water toys. New stair fabrication in the superstructure and a complete repainting of the upper structure finalize the project's structural and functional transformation.

In the superyacht world, refit projects are evolving beyond the traditional maintenance-repair cycle into a field that demands high engineering expertise and advanced craftsmanship. The projects carried out under Mengl Yag's revivo brand clearly demonstrate how this approach is rooted in the shipyard's technical know-how derived from its new-build heritage.

Extending a hull by two meters and recalibrating the vessel's technical balance (TTC) or modernizing the interior of a twenty-year-old superyacht while

preserving its original character (RTS), requires structural engineering and refined craftsmanship well beyond standard refit practices. Mechanical revivals and infrastructure renewals performed within RINA classification processes further reinforce this technical rigor.

These projects show that Mengl Yag approaches refit not as a series-production maintenance service but as a boutique practice, delivering yacht-specific engineering solutions tailored to each vessel.

Strong Infrastructure

Precision Engineering, Boutique Solutions

Located in the heart of Altnova, Barka Shipyard combines the technical capacity of the Marmara maritime production ecosystem with a modern refit discipline. The shipyard's approach goes far beyond a standard maintenance and repair process; each project is designed as an engineering craft that carries a yacht's operational performance into the future while managing every technical detail with precision. From electronic integrations to hull and superstructure interventions, every stage reflects Barka's predictable, transparent, and solution-oriented character in the superyacht segment.

Project Highlights

M/Y Indian Empress (Comprehensive Technical Refit)

The mechanical, deck, and general technical systems of this high-tonnage superyacht were modernized, improving operational efficiency. Disciplined project management and a controlled workflow ensured the vessel's long-term performance.

S/Y EOS (Refit and Maintenance)

One of the world's largest sailing yachts, EOS demonstrates Barka's capability in operations requiring extreme precision. Hull maintenance, system checks, and deck equipment were managed simultaneously, while on-site logistical coordination ensured the flawless execution of complex processes.

M/Y Flying Fox (Maintenance and Technical Operations)

The maintenance of this 136-meter mega yacht required large-scale technical planning and shipyard logistics. Through careful operational preparation and coordination, Borka showcased its expertise in handling high-tonnage projects.

M/Y Deep Story (Refit with an Aesthetic-Operational Balance)

In mid-size yacht projects, the balance between technical revision and aesthetic enhancement stands out. Hull maintenance, paint applications, and comprehensive technical servicing preserved both the yacht's performance and visual standards at the highest level.

BERKAR SHIPYARD

In the superyacht world, refit has evolved beyond the traditional maintenance-repair cycle into a transformation field that demands high engineering and advanced craftsmanship. Berkar Shipyard's projects reveal how strong facility infrastructure and fleet organization can merge technical precision with a boutique approach, whether enhancing the operational efficiency of a large superyacht (Indian Empress) or executing a complex sailing yacht refit with exceptional care (EOS). Berkar reinforces its position in Türkiye's refit market as a shipyard that balances scale with engineering—delivering fast, transparent, and solution-driven results.

Integrated Expertise in Refit

AEGEAN YACHT

1976

BUILDING

BROKERAGE

REFIT

Founded in Bodrum in 1976, Aegean Yacht is a leading shipyard providing full-service and tailor-made solutions for steel and aluminum sailing yachts and motor yachts. The yard builds yachts from 20 to over 60 meters in compliance with RINA and MCA standards, combining reliable engineering with true seagoing performance through more than 50 years of experience and over 50 delivered yachts.

Aegean Yacht operates from its private 30,000 m² seafront facility, featuring 5,500 m² of covered new-build and refit hangars. Its production infrastructure, capable of handling yachts up to 78 meters, enables the shipyard to deliver premium quality on large-scale projects.

Refit Capabilities

Refit projects at Aegean Yacht cover a wide technical spectrum, including hull and superstructure works, paint and varnish applications, mechanical and electrical system overhauls, interior and carpentry works, teak deck installations, as well as mast and rigging systems.

The shipyard carries out refit and dry dock operations for approximately 50 yachts annually.

Project Highlights

300t Ferretti 80: Complete deck replacement, new generator installation, renewal of air-conditioning systems, exterior surface polishing.

32.50 m steel yacht (built 2006): Complete renewal of mechanical and electrical systems, engine overhaul, installation of a new generator.

17 m single mast gulet (built 1976): Comprehensive refit process nearing completion.

The yachts are also offered for sale through Aegean Yacht's brokerage services, providing owners with both maintenance support and investment opportunities.

Shipyard

30,000 m² total area, 5,500 m² covered hangar

400-ton lifting capacity, accommodating yachts up to 50 m

Integrated new-build and refit services with more than 120 engineers and craftsmen

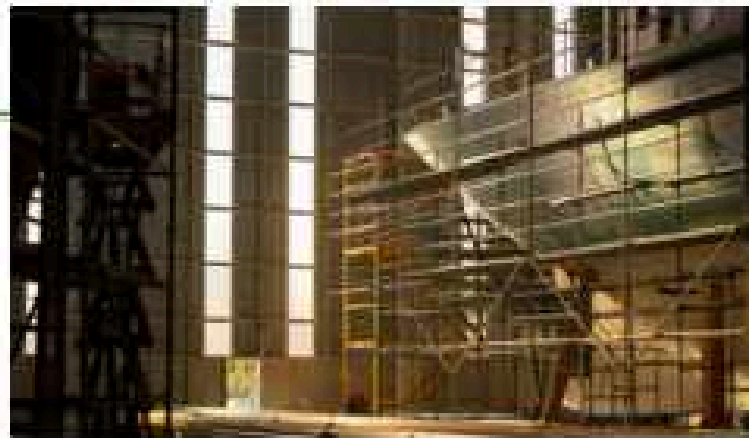

With its ongoing infrastructure investments aimed at delivering premium solutions for large-scale and technically complex projects, Aegean Yacht positions itself as one of the key hubs in both the Turkish and global yachting markets.

+90 252 552 50 70

yachtbuilding@aegeanyacht.com

Turkey/Izmir No. 192, Oran/Mugla, 48220

Aegean Yacht stands out in Bodrum as a hub focused on large-scale and technically complex yacht projects, combining integration and technical capability under one roof. With its modern infrastructure and experienced team, the yard provides owners with comprehensive support from project planning to lifetime service. This approach further strengthens its position as a reliable premium partner in both the Turkish and global yachting markets.

Bodrum's Deep-Rooted Shipyard Tradition

Located in the İcmeler area of Bodrum, Aganlar Shipyard continues more than half a century of shipbuilding heritage with modern refit infrastructure, offering maintenance, repair, and comprehensive refit services to yachts from both Türkiye and across the globe.

Established in 1961, the shipyard continues to operate as a representative of one of Bodrum's most established shipbuilding traditions. With continuously developing infrastructure and expert teams, Aganlar Shipyard stands out as a key technical center where traditional shipyard culture meets contemporary yacht refit processes.

Today, the facility spans approximately 47,000 m², featuring four hangars and a large slipway area, primarily serving yachts of 20 meters and above. On average, the shipyard handles maintenance, repair, and refit operations for 30-35 yachts annually.

Refit Capabilities

Over the years, Aganter Shipyard's scope has evolved from basic haul-out and maintenance services to comprehensive refit projects. Its operations cover a wide technical spectrum, including paint applications, teak deck renewals, mechanical system overhauls, carpentry and interior restorations, as well as electrical and electronic system modernization, and mast and rigging services.

Paint applications represent a significant portion of refit activities. Each year, the shipyard undertakes full-scale paint projects for 2-3 superyachts. These projects typically involve complete renewal of hull and superstructure coatings. The process is a multi-stage technical operation including surface preparation, removal of old paint layers, fairing and priming, followed by final coating applications.

Teak decking is another core area of expertise. The shipyard installs approximately 800-1000 m² of teak decking annually. This includes removal of existing decks, substrate preparation, fabrication of new teak panels, installation, and caulking, all carried out by experienced teams.

Mechanical works within refit projects include maintenance of seawater and freshwater systems, dismantling and reinstallation of rudder and shaft systems, shaft alignment and vibration checks, as well as servicing of pumps and cooling systems. In terms of electrical and electronic modernization, navigation equipment, power distribution systems, automation infrastructure, and lighting solutions are upgraded in-house.

In sailing yacht refit projects, mast and rigging systems are also among the shipyard's core technical areas of expertise. Mast removal and installation operations, as well as the renewal of wire and rod systems, can be carried out on-site. In addition, thanks to the rod head swaging machine, the production and maintenance processes of rod systems can also be performed within the facility.

Shipyard

47,000m² total area in Bodrum, İzmir

4 Hangars and extensive slipway area

Capacity for yachts: 20 meters and above

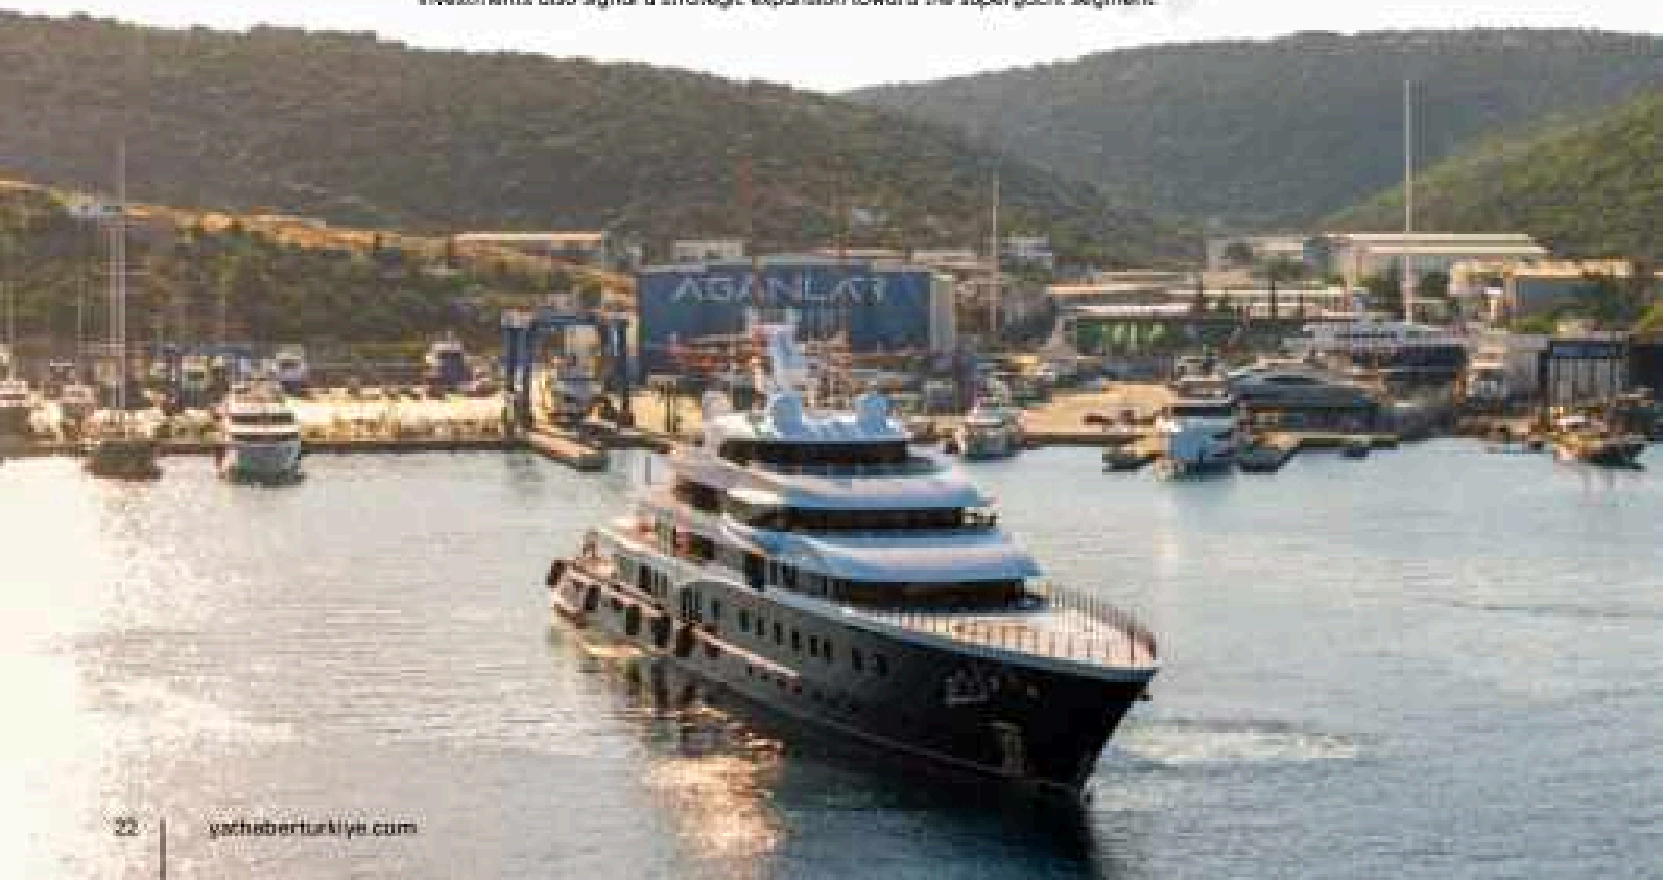

Annual average of 30-35 yacht maintenance and refit operations

The shipyard is also working on new investments to meet increasing superyacht refit demand. Planned developments include the installation of a floating pontoon system for superyachts and megayachts, as well as a travel lift with a lifting capacity of approximately 1,500-1,600 tons. These investments aim to enable the handling of larger tonnage yachts and the execution of more extensive refit projects.

While Bodrum has long stood out as one of the Mediterranean's key yachting destinations, local shipyards are playing an increasingly important role in refit projects. With a history spanning over half a century, Aganlar Shipyard remains one of the most established representatives of this tradition.

Its technical capacity—ranging from haul-out operations to comprehensive maintenance and refit projects—demonstrates how Bodrum's traditional shipyard culture continues to evolve through modern refit practices. Expertise in areas such as paint applications, teak decking, and mechanical refits further strengthens the shipyard's position within the regional refit ecosystem. Planned infrastructure investments also signal a strategic expansion toward the superyacht segment.

DUNYA YACHTS

Strong Infrastructure

Precision Engineering, Comprehensive Solutions

Located in the heart of Tuzla, Dunya Yachts brings together modern yacht and shipbuilding facilities with advanced engineering disciplines. Active in the industry since 1985, the shipyard underwent a major modernization in 2005, becoming one of Türkiye's largest and most technically equipped centers for superyacht maintenance, repair, and refit projects. From electronic integrations to hull and superstructure interventions, every stage reflects Dunya Yachts' high-quality standards and meticulous approach to field operations.

Project Highlights

Dunya Yachts serves a wide spectrum of projects in both new-build and refit segments. With facilities capable of accommodating yachts up to 100 meters and specialized workshops, the shipyard manages each project with technical precision and operational discipline.

Axioma (Formerly Red Square, 75m - New Build)

Considered one of the most prestigious yachts built in Türkiye, Axioma demonstrates Dunya Yachts' technical infrastructure and project management capability.

M/Y King Benji (47m), M/Y Dream On (38m), M/Y Cocouna (36m)

New-build projects in the mid-size superyacht segment highlight the shipyard's attention to detail and disciplined operational approach.

Major Refit Projects (25+ Superyachts)

Iconic yachts such as *Titanic* (73m), *Il Vagabondo* (60m), *Achilles* (55m), *Ruhli* (48m), *Coert* (54m), *DB9* (50m), *Azamarita* (55m), and the classic *M/V Savorana* (36m) reinforce Dunya Yachts' expertise in mechanical, electrical, piping, deck, and aesthetic interventions.

Shipyard Facilities

A fully enclosed, climate-controlled dry dock for yachts up to 60 meters.

Two large covered hangars measuring 80m and 110m in length, with a total of 3,000 m² of workshop space.

A third, smaller hangar accommodating yachts up to 40 meters.

1,600 m² of office space providing a comfortable working environment for technical and administrative teams, along with social areas for visiting crew.

📍 Güzelçifti Mh. Sahil Bulvarı Yeniceyiti Sk.

No: 8/A-1 Pendik, 34903, Istanbul, Turkey

Superyacht refit has evolved beyond the traditional maintenance and repair cycle into a field that demands high engineering expertise and advanced craftsmanship. Dunya Yachts combines robust infrastructure with disciplined project management, delivering technically precise and well-coordinated operations. Whether undertaking comprehensive refits on large-tonnage yachts such as *Titanic* and *Savorana* or executing mid-size new-build projects like *Kong Beng* and *Dream On*, the shipyard reinforces its position in Türkiye and the wider region as a yard that balances scale with engineering excellence in the refit market.

The Most Refined
Expression of
Engineering

PETRA SF-39

Positioned in the global market with its durability, confidence-inspiring hull engineering and function-driven design philosophy, Mercan Yachting has developed a distinctive language in the sport fishing boat segment over the years. The brand's approach is built on a holistic engineering mindset that places performance, aesthetics and maritime safety on equal footing. This disciplined heritage evolves into a progressively refined experience with each model. Petra SF-39 stands as the latest and most sophisticated expression of that accumulated expertise.

With an overall length of 11.65 metres and a beam of 3.82 metres, the model delivers maximum functionality within compact dimensions. Its offshore hull form combines open-sea capability with a safe and controlled ride. The Class B design category provides reassurance even in challenging weather conditions, while the 0.65-metre draft makes the vessel well suited for flexible operation across diverse cruising grounds.

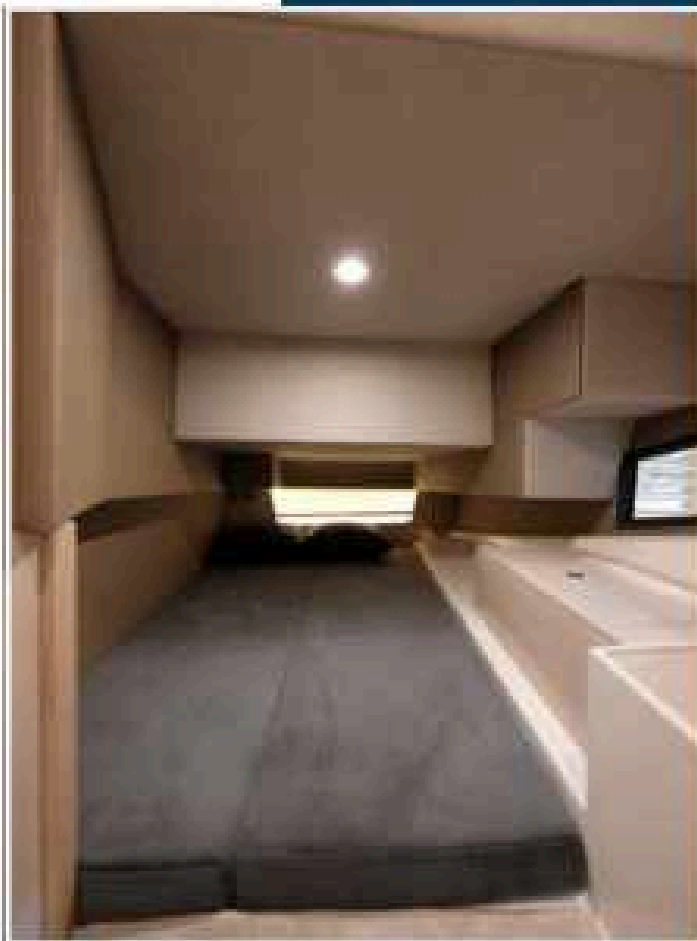

What truly distinguishes the Petra SP-39, however, is not only its technical capacity. The model introduces a spatial configuration that redefines sport fishing: integrated interior and exterior living areas, paired with a design language that maximises natural light, create a notably airy atmosphere. The walk-around deck plan, wide aft platform and fishing-focused ergonomics transform the boat from a pure performance tool into a versatile social platform.

The layout features two cabins, one bathroom and a functional helm area, complemented by a galley and dining space—offering a compact yet cohesive living arrangement. Every detail has been planned around real usage scenarios. The model is offered in two layout alternatives: a configuration optimised for day use (Module 1) and a sport-fishing-focused configuration (Module 2). The aft cockpit seating arrangement varies functionally between these modules. The modular structure allows further personalisation through options such as a second helm station and tuna door, reflecting Mercon Yachting's positioning closer to a semi-custom production philosophy rather than pure serial manufacturing.

Power comes from twin Mercury 425 hp Verado V10 (5.7L) engines paired with the J/PO system, supporting strong speed performance with precise manoeuvrability. Equipment such as the electric steering option, joystick-controlled interceptor trim tab system and solar panel infrastructure demonstrates that the platform is not only powerful but also technologically current. An 800-litre fuel capacity, 200-litre freshwater tank and generous livewell volumes provide a significant operational advantage for extended fishing trips.

With a dry displacement of 6,880 kg and 9,045 kg at full load, the hull structure establishes a deliberate balance between performance and stability through well-managed weight distribution. The platform's maximum engine capacity of up to 900 hp further indicates that its potential extends well beyond the current configuration.

Petra SF-39 is a reminder that design is not merely an aesthetic surface, but gains true meaning when integrated with engineering, ergonomics and real maritime experience. Strengthening Mercan Yachting's position in the global market, the model brings together performance expectations and onboard living quality within the sport fishing segment.

Craftsmanship lies in the details. Innovation proves itself when those details are tested at sea.

MERCAN

YACHTING

Engineering Discipline in the Explorer Segment

Located in the Antalya Free Zone in the eastern Mediterranean, Naval Yachts positions itself in the explorer and long-range yacht segment with an engineering-driven approach. Evolving from a design-orientated structure into a fully integrated shipyard, the brand combines aluminum hull expertise, hybrid system integration, and strong in-house naval architecture capabilities bringing aesthetics and performance into the same equation.

What differentiates Naval Yachts is its interpretation of the explorer concept not merely as a stylistic category, but as a technical discipline defined by range, efficiency, and operational durability. Through its integrated production model in Antalya, the shipyard manages design, engineering, and construction processes under one roof, transforming this structure into a competitive advantage on a global scale.

We spoke with founders Dincer Dinc and Bora Dinc about the brand's engineering DNA, production strategy, and global vision.

"We define the technical problem before starting a project."

➤ **What is the core philosophy that defines Naval Yachts?**

- **Dincer Dinc:** Naval Yachts was born with the reflexes of a design office. When starting a project, we first define the technical problem: displacement balance, center of gravity, range optimization, and fuel efficiency. We do not shape the aesthetic language before clarifying hull form and engineering decisions. In the explorer segment, performance must be measurable and sustainable.

➤ **What does the Antalya Free Zone represent strategically?**

- **Bora Dinc:** The Antalya Free Zone offers a strong industrial ecosystem and supply chain network. It also provides operational flexibility for international projects: its geographic position creates advantages for Mediterranean-based deliveries, while the infrastructure supports logistical control in large-tonnage projects. This ensures stability in scheduling and quality management.

"The explorer spirit must be technically provable."

00000

00000

➤ **What makes the explorer segment distinct for you?**

- **Dincer Dinc:** The explorer spirit must be technically provable. A long-range claim cannot be explained solely by tonnage capacity. Hull resistance, engine room layout, insulation, vibration control, and fuel consumption curves must be evaluated together. For us, an explorer is a platform that delivers predictable performance during extended voyages.

"Refit projects provide field data."

- How does managing new build and refit projects together create an advantage?
- Bangs Ding: Refit projects provide valuable field data. We observe which systems are stressed during operation and which solutions perform better in the long term. This insight enables us to make more informed decisions in new build projects. The integrated model creates a strong feedback mechanism.

- What is the contribution of your in-house engineering structure?
- Binger Ding: Having design and engineering under the same roof accelerates decision-making. Revisions are handled in a more controlled manner. Reduced external dependency ensures technical consistency throughout the project. The knowledge gained from each project directly feeds into our institutional memory.

"Aluminum offers a strong balance between lightness and durability."

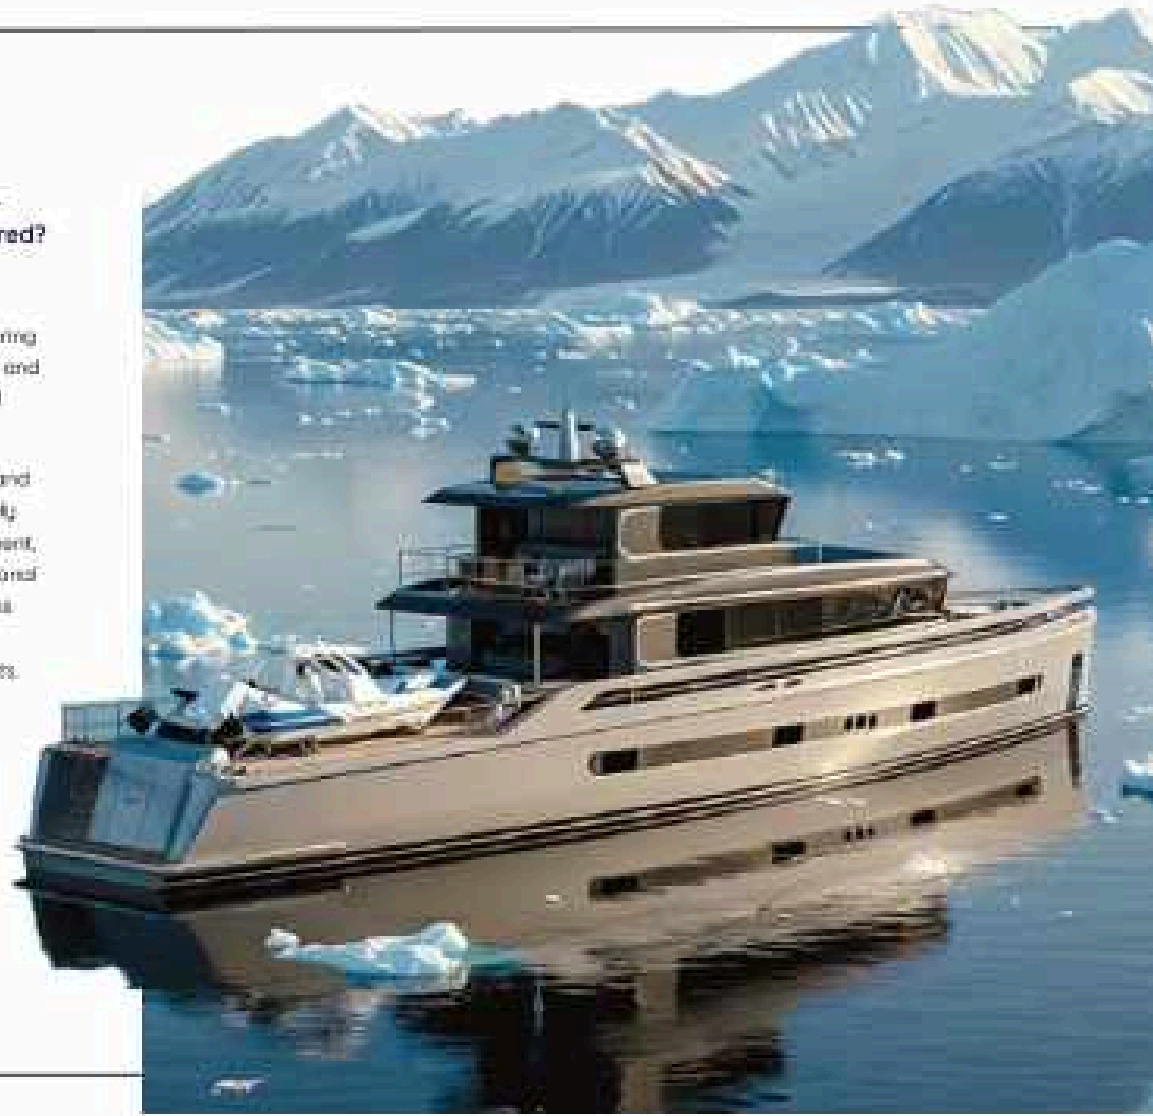

⇒ How would you define your aluminum hull and hybrid system approach?

- **Bang Ding:** Aluminum provides a strong balance between lightness and durability, creating advantages in range and performance. Hybrid system integration is important for energy efficiency and silent cruising. We consider sustainability as an engineering-driven development area and approach technology from a long-term investment perspective.

— Bang Ding

⇒ As two brothers, how is your management model structured?

- **Dincer Ding:** I focus on technical development, design, and engineering processes. The technical accuracy and structural decisions of projects fall within my responsibility.
- **Bang Ding:** I manage operational and commercial processes. I am actively involved in supply chain management, production planning, and international client relations. This division of roles accelerates decision-making and ensures consistency across projects.

— Bang Ding

⇒ How is your global client portfolio evolving?

- **Bang Ding:** Our clients are experienced yacht owners interested in long-range and exploration-focused vessels. We see active demand from Europe, the United States, and the Middle East. Technical transparency and engineering discipline create trust for international clients.

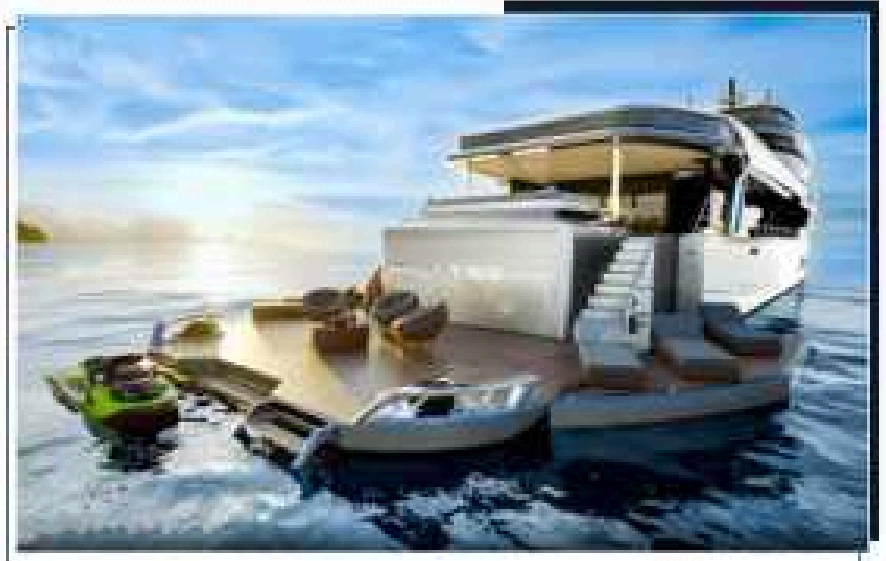

"Our growth strategy is built on expertise rather than volume."

How do you define Naval Yachts' position in the coming years?

- **Dincer Dinc:** Our priority is to further advance our technical capacity and strengthen our engineering infrastructure. We aim to deliver projects that are recognized as benchmarks in the explorer segment. Our growth approach is based on depth of expertise rather than volume increase.
- **Borg Dinc:** While increasing global visibility, maintaining production quality at the same level remains our core objective. We are pursuing a controlled and strategic expansion plan to achieve a stronger position in the international market.

With its engineering-based production philosophy, integrated shipyard model and technically grounded interpretation of the explorer concept, Naval Yachts positions itself as a rising reference point from the Eastern Mediterranean. Prioritizing technical depth over volumetric growth, the brand is building a structure centered on sustainable and measurable performance within the global explorer segment.

Extending from Antalya to the world, this engineering focus reinforces Naval Yachts' ambition to be not only a builder, but also a technical representative of the long-range exploration culture.

İÇ VE DIŞ TİCARET

Strong Supply Support for the Maritime Industry

Supplying piping materials primarily to the shipbuilding industry, as well as the chemical, energy, and oil & gas sectors, Asmarine operates with a strong stock structure and fast delivery capability across stainless steel, special alloy, and certified product groups. Increased inventory volumes, particularly in stainless steel and Corline materials, strategic partnerships with global manufacturers for special-size and special-grade products, and certification processes carried out in cooperation with classification societies form the backbone of the company's operational model.

With a customer-focused growth strategy aimed at expanding both product and service diversity, Asmarine seeks to provide sector-specific materials under competitive conditions within a sustainable supply framework.

We spoke with Asmarine General Manager Sinan Aytekin about the company's 2025 performance, leading product groups, and expectations for 2026.

"We deliver the right product, with the right quality certifications, at the right time and under competitive conditions. We are not just a supplier - we are a project solution partner."

— You supply piping materials mainly to shipbuilding, as well as the chemical, energy, and oil & gas sectors. Could you briefly describe Asmarine and your core service approach?

— Asmarine İç ve Dış Ticaret Ltd. Şti. is a specialized solution partner supplying piping materials primarily to shipbuilding, as well as the chemical, energy, and oil & gas industries.

— Our core approach is to deliver the right product, with the right quality certifications, at the right time and under competitive conditions. We are not merely a product supplier, we are also a business partner capable of project reading, technical validation, alternative manufacturer development, and rapid logistics organization.

— We build customer satisfaction on speed, transparency, and sustainable trust.

— How did your post-2020 policy of reaching more customers under more competitive conditions reflect on your 2025 performance?

— The expanded customer network and competitive supply model we adopted after 2020 had a direct positive impact on our 2025 performance.

— By collaborating with more manufacturers, we established a diversified supply chain. This structure made us more resilient to price fluctuations, shortened delivery times, and enabled us to offer flexible, project-based solutions.

— In 2025, we achieved sustainable growth both in our customer portfolio and transaction volume.

"The increase in our stock of cupronickel materials allowed us to fill a critical gap in the industry, providing shipyards with solutions within hours."

◦ You significantly strengthened your stock structure in 2025. How did your Cunife inventory strategy contribute to the sector?

◦ In 2025, we further reinforced our stock-based working model. Our substantial increase in Cunife (90/10 and T0/30) inventory filled an important gap in the industry.

In shipbuilding projects, long delivery times for Cunife materials often pose a critical risk. By eliminating this risk, we established an infrastructure capable of dispatching hard-to-source items within hours.

Through demand analysis, optimized maximum stock levels, and fast logistics organization, we created a system that minimizes time loss for shipyards.

"Customers now value not only price, but also delivery reliability, document accuracy, and long-term business partnerships."

◦ Stainless materials constitute your main product group. What kind of demand did you observe in this segment?

◦ Stainless steel pipes, fittings, and flanges form our core product segment. In 2025, we observed increased demand particularly for certified products and project-based special-size materials.

Customers now focus not only on price but also on delivery reliability, documentation accuracy, manufacturer quality, and long-term partnership criteria.

◦ How do your collaborations with classification societies in certified materials create a trust advantage for customers?

◦ Class-approved and certified material supply is a critical requirement, particularly in shipbuilding.

Through these collaborations, our customers can proceed confidently in international inspections and project approval processes without delays. At this stage, Asmarine acts not only as a supplier but as a risk-reducing solution partner.

- Q You work with leading global manufacturers in special-size and special-grade product groups. What supply model do you follow in this segment?

- A We implement a project-based supply model for special-size and special-grade materials.

This includes technical specification analysis, correct manufacturer selection, production process monitoring, and pre-delivery quality control. Our aim is to provide not just the product but a seamless project supply experience.

"We have made strong preparations for 2026; our inventory investments and expanded manufacturer network will enable us to respond quickly and securely to the growing demand in international orders."

- Q How do you foresee the expected increase in international shipbuilding orders in 2026 affecting supply processes?

- A We expect an increase in export-oriented shipbuilding projects in 2026. This will translate into shorter delivery times, higher stock requirements, and growing demand for certified materials.

With the stock investments and expanded manufacturer network established in 2025, we have made strong preparations for 2026.

- Q In line with your goal of expanding customer and product diversity in 2026, which areas will you focus on?

- A In 2026, our priorities include expanding our stocked product range, increasing special alloy materials for energy and chemical projects, and developing partnerships with new international manufacturers.

We also plan to enhance our digital order and stock tracking infrastructure to provide customers with faster and more transparent services.

By bringing technical expertise and a reliable supply infrastructure to every project, Asmarine continues to position itself as a solution-driven actor within the maritime and industrial supply sectors.

Energy Infrastructure in Yacht Projects: Seapower Perspective

Behind the aesthetics and comfort of yacht projects lies a robust technical backbone. Energy management, electrical systems, and power continuity are decisive factors for operational efficiency, safety, and sustainable performance. Particularly in international markets, the quality of this infrastructure directly impacts the overall success of a project.

Seapower brings its engineering expertise from ship and port energy systems into yacht projects by developing comprehensive shore power and power conversion solutions. With a portfolio ranging from frequency converters to regulation-compliant systems, the company positions itself as an active solution partner in international projects.

SEAPOW

Electrical Systems

Özcan Sevinç
Seapower Sales Manager

In this interview, Seapower Sales Manager Özcan Sevinç shares his perspective on the role of energy infrastructure in yacht projects.

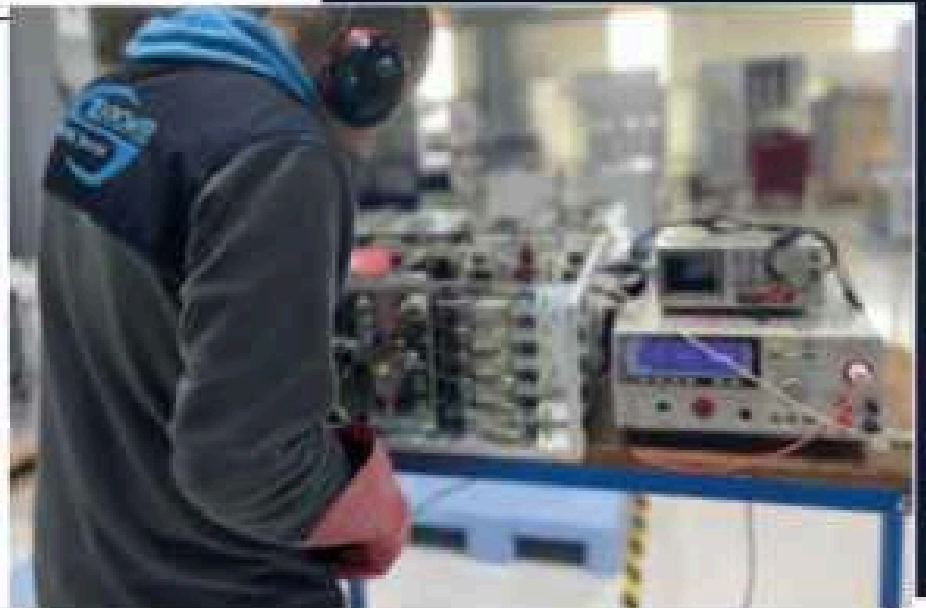

"We make the energy backbone that supports all onboard systems reliable and sustainable."

- ❖ In yacht projects, energy infrastructure often functions as an invisible backbone carrying all systems. How are Seapower's shore power and energy solutions positioned within this approach?

➤ We approach energy infrastructure not merely as a supply system, but as a critical engineering layer that supports comfort and operational functionality. Seapower's modular Shore Power Converter (SPC) platforms offer integrated architecture compatible with various marina and national grids, providing 50/60 Hz frequency conversion, voltage adaptation, isolation, and power quality functions.

Given the high comfort expectations in yacht projects, uninterrupted operation, low harmonic distortion, voltage stability, and seamless synchronization are key design criteria. With customer- and vessel-specific configurable SPC systems, we aim to make the energy backbone reliable and sustainable.

"Expanding shore power use significantly reduces fuel consumption, maintenance costs, noise, and emissions."

- ❖ Energy efficiency has become a core planning topic in yacht and marina operations. What technical advantages do Seapower's solutions offer?

➤ Seapower solutions are developed with high-efficiency power electronics topologies, optimized magnetic designs, and active power factor correction infrastructures to minimize conversion losses. Increasing the use of shore power reduces the need for onboard generators in port, leading to significant reductions in fuel consumption, maintenance costs, noise, and emissions.

On the marina side, load management and peak load optimization enable more balanced use of transformer and distribution infrastructure, lowering total cost of ownership. We address energy efficiency holistically—both at the yacht and marina scale.

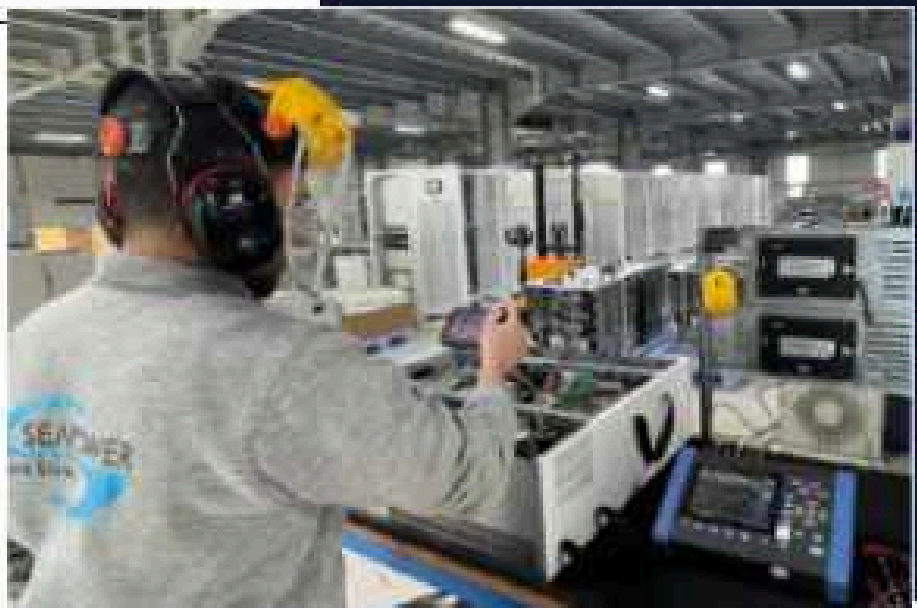

- ❖ Seapower is active in international projects through its engineering and production capabilities. How does your R&D approach support this position?

➤ Our R&D activities are shaped by real operational needs encountered in the field and the requirements of international standards. SPC systems, frequency converters, and power distribution solutions developed in-house undergo Factory Acceptance Tests (FAT), type and performance tests conducted by classification societies, Harbor Acceptance Tests (HAT), as well as long-term full-load and environmental endurance tests.

Thanks to our modular product architecture, we provide fast and flexible configurations for different power levels and application scenarios. Customer-specific requirements are implemented within a controlled and verifiable engineering framework. This approach plays a key role in positioning Seapower as a reliable and preferred technology provider in global projects.

*"SEAPOW
guarantees
operational
efficiency and
sustainability by
optimizing the
energy backbone
in ports."*

— Sustainability directly effects long-term decisions in yacht marinas and port investments. How would you define Seapower's expertise in Green Port projects?

- Global emission regulations—such as IMO targets and the EU's Fit for 55 and AFIR frameworks, including shore power/CPS requirements—have turned energy infrastructure into a strategic priority in port investments. Green Port projects are no longer just an environmental preference; they are a regulatory and competitive necessity.

In this transformation, Seapower provides shore power (CPS) systems, high-power static frequency converters (SPC), and power quality solutions. These systems ensure safe conversion between different frequency and voltage levels, reducing generator usage in port and lowering emissions.

Our expertise focuses on load analysis, scalable architectural design, and regulation-compliant system engineering—offering long-term efficiency and reduced total cost of ownership for port operators.

— Maritime investments globally are shaped by technical standards. How do you evaluate Seapower's position in global markets?

- Seapower solutions are designed in compliance with IEC 60005, IEC 61892, and relevant classification society standards. Our modular system architecture, developed with consideration for different regulatory environments and grid characteristics worldwide, enables rapid adaptation in global projects.

This technical flexibility positions our company not only as a reputable supplier in global markets but also as a strong solution partner with advanced engineering capabilities.

"We secure yacht energy infrastructure through project-specific design and uninterrupted support."

— The yacht sector expects continuity and reliable partnerships in technical systems. How does Seapower respond to this expectation?

- In yacht projects, uninterrupted and seamless operation of energy infrastructure is critical to project success. Seapower offers project-specific electrical architecture design, single-line diagrams, short-circuit and selectivity analyses, on-site commissioning, and after-sales technical support.

Due to high comfort expectations, yachts are among the most sensitive application areas in terms of energy tolerance. Accordingly, our solutions prioritize operational continuity, high power quality, custom-designed shore power converter systems with minimized dimensions, and user-focused design criteria.

• **System integration and energy optimization are gaining importance in marine electronics. What technological areas is Seapower focusing on for the future?**

Seapower's modular SPG and frequency converter platforms are field-proven, featuring parallel operation capability, high-efficiency power electronics topologies, and advanced power quality functions. Energy efficiency-based on high efficiency, low loss, and optimized load sharing remains a core design principle.

Our R&D efforts focus on hybrid architectures where shore power infrastructures can integrate with energy storage systems, as well as advanced control algorithms that optimize grid-load interaction. On the digital side, we are developing energy management platforms offering remote monitoring, predictive maintenance, and performance analytics.

This enables us to deliver scalable and long-term sustainable solutions in system integration and energy optimization.

• **Energy regulations are reshaping planning and investment processes in maritime projects. What kind of technical roadmap does Seapower offer to its clients?**

We address energy regulations not only within current requirements but also from the perspective of standards expected to enter into force in the future. Through technical feasibility studies at the project's outset, regulatory compliance analyses, and forward-looking infrastructure planning, we provide clients with a long-term technical roadmap.

Our objective is to ensure that investments remain sustainable and regulation-compliant without incurring additional revision costs in later stages.

With its engineering-driven approach, modular technology platforms, and regulation-focused system design, Seapower strengthens the invisible yet critical energy backbone of yacht and port projects transforming power infrastructure into a measurable advantage in operational efficiency, sustainability, and global competitiveness.

Mengi Yay Announces Sale of Nuvolari Lenard Plus 52 - NB114

Mengi Yay Yachts has announced the sale of the 52 ft. name Nuvolari Lenard Plus 52 - NB114 project. The superyacht, currently under construction in Istanbul, is scheduled for delivery in 2023.

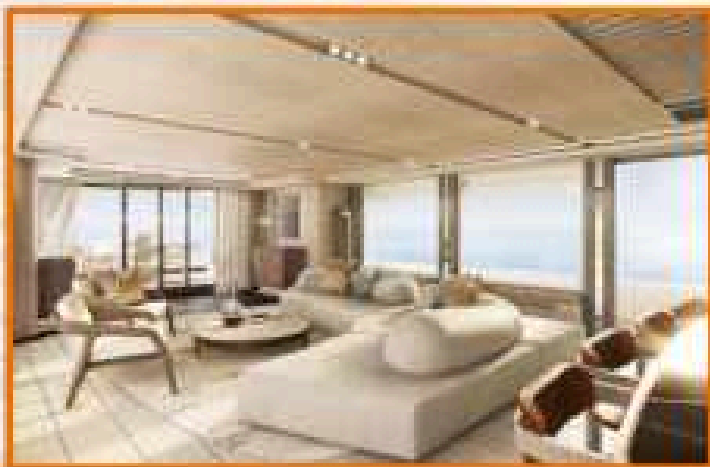

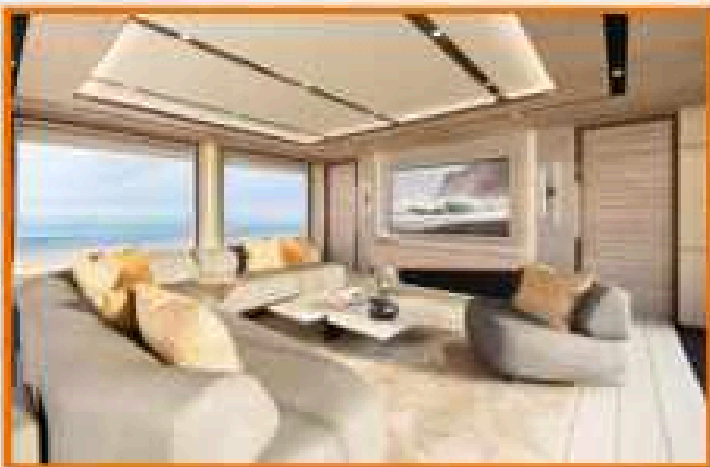

The sale marks a new milestone in the long-standing collaboration between Mengi Yay and Italian design studio Nuvolari Lenard. The strategic partnership between the two brands continues through the Nuvolari Lenard Plus 52 platform.

Heng Yu, CEO of Huxley, Heng emphasized that Nuvolet Lendol being a strong design ally to the project and contributed to building a sustainable foundation for cooperation. Following the vessel sale, construction of the second hull (N8114) has also commenced on the same platform.

The project represents the fourth collaboration between Heng Yu and Nuvolet Lendol. Carla Nuvolet highlighted that the partnership has evolved on the basis of shared values, trust, and a long-term vision, while Dan Lendol stated that the P45 52 platform reflects a true 52-metre length, a commitment to on-time delivery, and more than three decades of design experience.

The 52.6-metre N8114, positioned below the 500-GT threshold, combines the design language of Nuvolet Lendol with the engineering expertise of Van Dessel's Naval Architects. The project is being built to RINA class certification standards.

AMANDA

metre

Diesel Electric

58

Superyacht

Turkish yachtport Nebuta Yachts has launched its 58 metre motor yacht Amanda, a generating unit of 124000hp from 5000 YTDH at approximately 130 knots, the project should bring a significant delivery showcasing the company's engineering expertise and manufacturing capability in the global market.

“A yacht begins with technical drawings... but is completed with belief”

Speaking at the launch ceremony, Nebuta Yacht CEO Serkan Süer thanked the project team and station partners, stating:

“I extend my gratitude to all of you for being here with us today. This project once again demonstrates the strength of Turkish engineering and our industry's global competitiveness.”

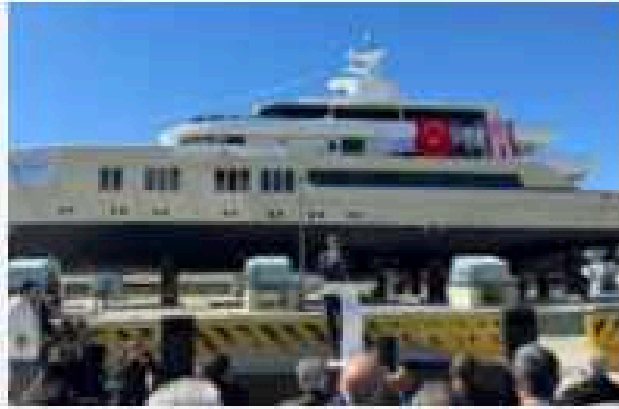

Süer highlighted the contribution of a core project team of approximately 300 people, supported by thousands across the supply chain and partner network. He emphasized that Türkiye's position as the world's second-largest superyacht producer has been achieved through engineering capability, production discipline, and long-term vision. The yacht's diesel-electric propulsion system, he added, reflects a forward-looking technological approach aligned with the future of maritime innovation.

Design and operational efficiency

Measuring 58 metres LOA with a volume of 1,200 GT, Amanda features seven decks offering expansive living spaces. The yacht accommodates up to 14 guests in commercial configuration or 12 guests for private use across 5 guest cabins. Operations are designed to be managed by a professional crew of 17's.

The exterior design bears the signature of Norwegian designer Espen Riso, combining timeless proportions with a balanced profile that merges aesthetics and functionality within the global superyacht segment. All technical processes including design integration and systems engineering - were carried out by Turkish engineering teams.

Innovative energy and technology infrastructure

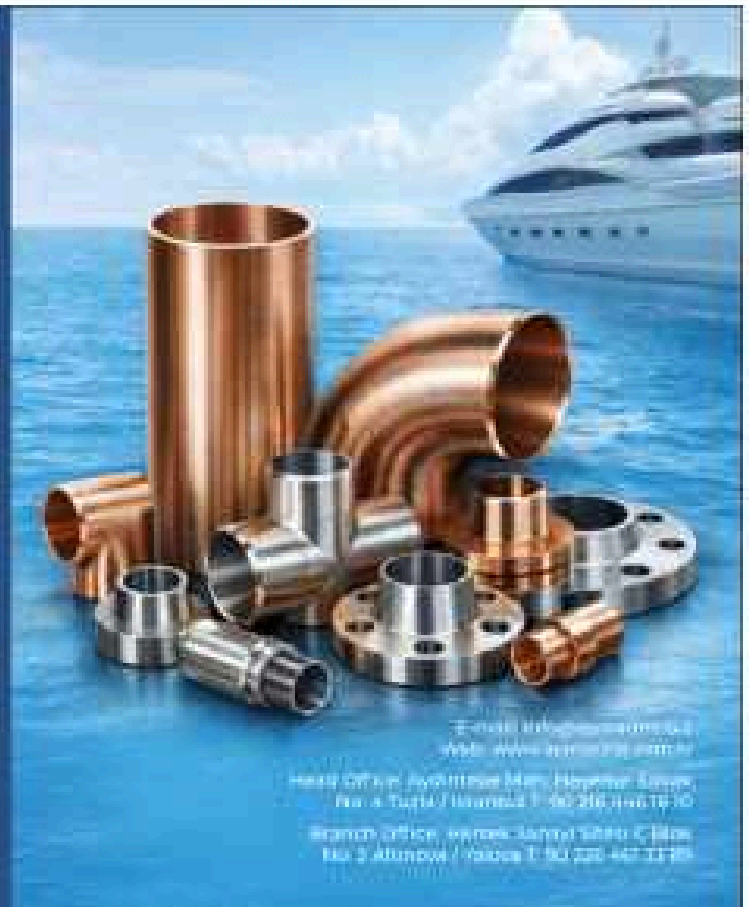

Amanda is equipped with three 650 kW diesel-electric main propulsion units. This configuration ensures low vibration levels, optimized fuel consumption, and reduced acoustic footprint, meeting both environmental sensitivity and onboard comfort expectations. The system architecture is compatible with hybrid solutions and aligned with emerging energy-efficiency trends in maritime technology.

Strong Stock, Fast Delivery in CuNiFe Materials

Reliable supply of stainless steel,
aluminum, carbon steel,
and special alloys.

Begüm Group Introduces New Physical Supply Structure: BE Bunker

Begüm Group of Companies has announced BE Bunker, its new structure in the fuel supply sector. Having served superyacht operations in Turkish waters for many years, the group is now transferring this experience into the bunkering field through a physical supply model.

BE Bunker is positioned as more than a conventional fuel supply initiative. The brand offers an integrated structure that brings together price transparency, supply security, and operational control under one umbrella. The fact that fuel represents both one of the most critical cost items and one of the most uncertain risks in yacht operations forms the main foundation of this strategic step.

Under the new model, fuel will be sourced directly from origin, aiming to eliminate intermediary chains. This approach is designed to create a more predictable pricing structure while ensuring stronger control over quality standards and operational speed. BE Bunker will provide fast and competitive fuel supply services across Türkiye, supported by Begüm Group's strong financial infrastructure and operational expertise.

Begüm Group of Companies CEO Begüm Doğulu summarized the brand's approach with the following words:

"We do not see fuel simply as a product to be procured. We aimed to build a planning-based structure centered on control and transparency. BE Bunker is the concrete reflection of this mindset."

Initially positioned as a strong component within the group's own operations, BE Bunker is expected to expand this systematic approach to a broader maritime ecosystem in the coming stages.

TURQUOISE
YACHTS

..... Launcher 67.7-Metric

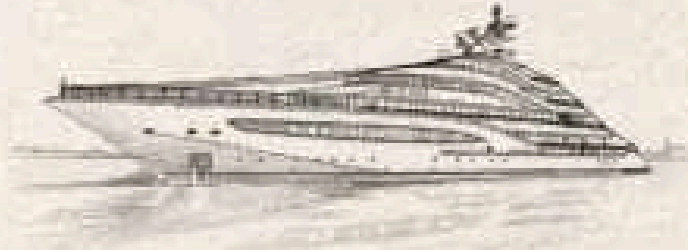

Superyacht
VENTO

Turquoise Yachts has launched Vento, the largest yacht ever built by the shipyard, at its facilities in Pendik, Istanbul. Measuring 87.7 metres and offering a volume of 2,950 GT, the project now stands as the yard's new flagship.

Construction began in 2021, and the yacht, previously known as Project Vento during development, marks the ninth new-build collaboration between Turquoise Yachts and H2 Yacht Design. Both the exterior and interior design were developed by H2 Yacht Design, while owner's representation is handled by Occam Marine.

Occam Marine Co-Founder Giles Frankel described the cooperation with Turquoise as being defined by transparency, a strong focus on quality, and a collaborative working culture.

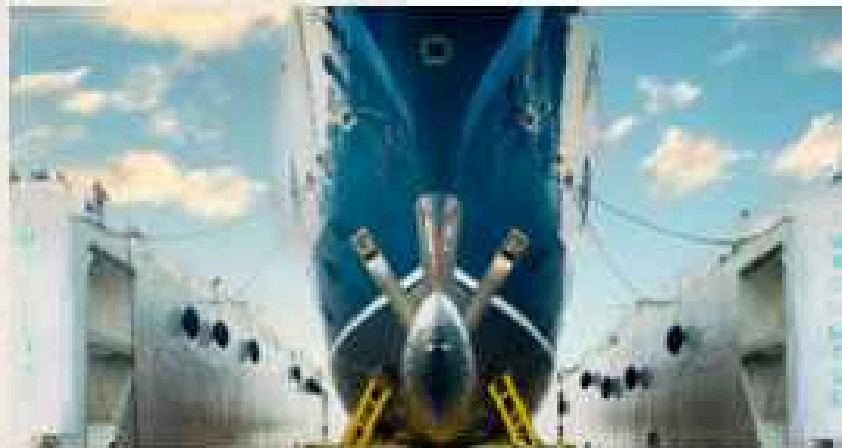

The owner of Vento first became publicly known in 2023, when the yacht was transferred from Rodol to Ferdi for outfitting works. With a length of 87.7 metres, the new flagship surpasses the previously delivered 79-metre *Nymphes*, becoming the largest project in Turgut's Yachts' history.

Featuring a classic bow profile, balanced proportions and a dark blue hull, Vento achieves a strong balance between sporty lines and a timeless silhouette. The flowing superstructure design and controlled use of surfaces contribute to a cohesive and elegant overall appearance.

The yacht accommodates up to 12 guests across seven cabins, including a convertible Super VIP suite and a dedicated owner's deck. A spiral staircase connecting all levels and a large skylight that brings natural light into the interior stand out as key design features on the main deck.

Notable onboard amenities include a 6.5-metre glass-edged swimming pool, a versatile open foredeck capable of supporting helicopter operations, expansive sunbathing areas, and a beach club with direct access to the sea.

Relaxation and entertainment are central to the concept, with two jacuzzis, a spa area featuring a hammam and sauna, a panoramic gym, and a golf simulator completing the yacht's lifestyle offering.

AW

ADAYACHTWORKS

Ada Yacht Works has officially launched the construction of its new 49.9-metre superyacht *DoGuSha VII* following the completion of the keel-laying ceremony. Scheduled for delivery in 2028, the model marks the shipyard's fourth hull on its 50-metre platform and stands as the first unit of the new Elite Series, fully designed and developed by Luca Dini Design & Architecture.

Now under construction at the yard's production facilities, *DoGuSha VII* will feature a steel hull and aluminum superstructure, delivering a volume of 499 GT. Both exterior and interior design bear the signature of Luca Dini Design & Architecture, while naval architecture is handled by Ginton Naval Architects and engineering development by The Circle Naval Architecture. The resulting technical configuration aims to balance performance with optimal volume efficiency.

With a beam of 8.8 metres and a draft of 2.6 metres, the superyacht is designed to accommodate 14 guests across six cabins and a crew of 10 in five cabins. Powered by twin MAN main engines, the yacht is expected to reach a top speed of 16.5 knots and a cruising speed of 12 knots, offering operational flexibility for long-range Mediterranean and beyond itineraries.

The strategic collaboration between Ada Yacht Works and Luca Dini Design & Architecture gained momentum last year with the interior design of the 50-metre *Legnsea*, unveiled at the Monaco Yacht Show, and has since deepened with two additional projects currently under construction. *DoGuSha VII* further crystallises the partnership's design language under the Elite Series umbrella while reinforcing the shipyard's upward trajectory in the 50-metre segment.

Meanswhile, the yard's production line includes three additional 50-metre projects. The second and third units, featuring exterior design by Ullaas Yacht Design, are scheduled for delivery within the year—highlighting the brand's growing momentum and delivery performance in the 50-metre class.

RMK Marine Establishes a Dedicated New Production Base for the Yacht Segment

One of Türkiye's long-established shipbuilding brands, RMK Marine is advancing its strong engineering heritage from commercial and naval projects into the yacht segment through a distinct new structure. The company has initiated construction in Yalova for the new RMK Yachts Shipyard, which will focus exclusively on yacht production.

Under the strategic investment plan, yacht manufacturing will be separated from the existing Tuzla facilities and relocated to the new Yalova campus. While Tuzla operations will continue to concentrate on commercial and naval projects, the new shipyard is being configured in line with high-quality standards, refined aesthetics and advanced engineering requirements. This separation introduces a specialised model that deepens the company's production culture.

Located on a seafront site of approximately 70,000 square metres, the facility is targeted to reach full operational capacity by 2027. The investment aims to build the infrastructure that will position the RMK Yachts brand more strongly within the global megayacht market.

Planned with a strong sustainability focus, the campus will prioritise LEED standards, renewable energy utilisation and a low-carbon operational model. With production halls, refit areas, extensive quay capacity and high-tonnage travel lift infrastructure, the facility is designed to provide operational flexibility for both newbuild and conversion projects.

This move signals RMK Marine's strategic repositioning of its shipbuilding heritage in the yacht segment through a scalable and long-term growth vision.

RMI REGISTRY CONTINUES TO BOOST YACHT TECHNICAL RESOURCES

Today's yachts are more sophisticated and connected than ever before. Rapid development of intelligent ship management and operational tools from the bridge to the engine room, as well as changes to propulsion and regulations in marina operations continue to drive the yachting industry forward.

International Registries, Inc. and its affiliates (IRI), which provide administrative and technical support to the Republic of the Marshall Islands (RMI) Registry, is a leader in yacht technical support. From 28 offices worldwide, including four specialized yacht centers: Fort Lauderdale, United States; Geneva, Switzerland; Istanbul, Türkiye; and Roosendaal, The Netherlands, IRI's specialized Yacht Team aims to give captains and owners of RMI-flagged yachts the confidence to make informed decisions.

"Yachting is rapidly evolving, both in onboard technology, and in the regulation surrounding worldwide yachting," said Patrick Bachofner, Director, Geneva Office and Worldwide Director, Yachts for IRI. "Updates to SOLAS Regulation V/23 and the IMO performance standards for pilot transfer arrangements, which enters into force on 1 January 2028, may have a significant impact on yacht design and architecture."

To support captains and owners as they make compliance decisions and adopt increasingly complex onboard systems, the RMI Registry continues to expand in-country administrative and technical support.

"The impact of these changes may be far reaching in the long term, especially these upcoming changes to pilot transfer arrangements," said Istanbul based Cem Çakmak,

Senior Technical Manager, Yachts. "Our technical support is complimentary and available in key yachting hubs."

IRI's recent investment in expanded support in Istanbul reflects Türkiye's growing influence in global yachting. In late 2025, IRI hired İrem Yıldız as Assistant Technical Manager, Yachts in Istanbul. İrem, a graduate of Istanbul Technical University with a degree in Naval Architecture and Marine Engineering, previously worked with the Newbuilding Department at Türk Loydu. İrem supports yacht newbuild and fleet activities, working closely with shipyards, designers, captains, and owners.

"We want owners and captains of RMI-flagged yachts to have access to our specialized and experienced yacht technical resources and benefit from the strength of our commercial fleet operations teams when it comes to compliance solutions for the future," Cem said.

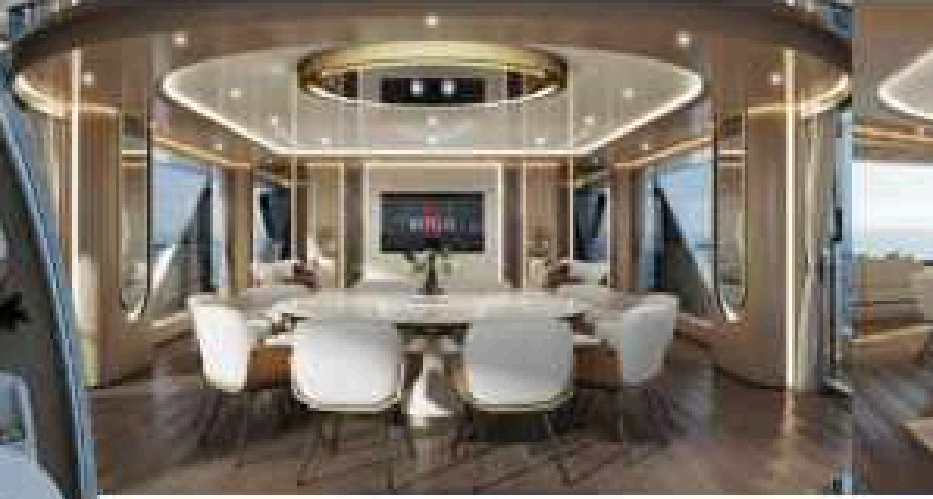

The RMI Yacht Registry is one of the largest yacht registries worldwide, with 1,283 yachts ranging in size from 12 meters (m) to more than 100 m as of 28 February 2026. As new technologies and regulations continue to transform the yachting industry, the RMI Registry is committed to supporting innovation through expert technical guidance and global collaboration. Expansion of specialized yacht technical resources, and the strength of RMI's global fleet operations and technical teams, ensure that the Registry is equipped for a changing world.

KRC Yachting Unveils New 36-Metre Project: KRC120 OPERA

KRC Yachting has introduced the KRC120 OPERA, the newest model in its developing KRC series. The 36-metre superyacht features a steel hull and aluminum superstructure, with delivery planned after an estimated 24-month construction period. The project reflects the shipyard's strategy to evolve its semi-custom production approach into a more flexible, lifestyle-focused platform.

OPERA combines engineering efficiency with a refined design language within a balanced platform. The exterior styling and interior concept were developed in collaboration with Italian designer Gabriele Teruzzi. The yacht's contemporary silhouette is supported by large glass surfaces and fluid spatial transitions, aiming to create strong continuity between interior and exterior living areas.

Key social features include a pool positioned on the aft deck and expansive sunbathing areas, both defining elements of the yacht's lifestyle-oriented character. Open-air lounge and dining areas are complemented by shaded solutions designed for warm-climate use, while the upper deck and sundeck are planned to accommodate both private relaxation and entertainment-focused scenarios.

One of OPERA's most notable features is its high level of customization within a structured build process. The layout, which includes an owner's suite and four guest cabins on the main deck, can be reconfigured through alternative arrangement scenarios. Interior layouts can also be adapted to match the owner's lifestyle, and the shipyard notes that the upper-deck salon may optionally be redesigned as an owner's suite. The yacht accommodates up to 10 guests, while operational efficiency is maintained through dedicated crew areas, including three double crew cabins and a private captain's cabin for a total crew of seven, including the captain.

With its steel hull and aluminum superstructure, the 36-metre platform offers a solid technical foundation within its segment. Developed under KRC Yachting's in-house engineering framework, the project emphasizes balanced volume planning and functional usability in the 35-40 metre class.

Positioned as a model that combines the discipline of series production with custom-level flexibility, the KRC120 OPERA stands out as a significant step in strengthening KRC Yachting's presence in the international market, offering a strong balance between design, volume efficiency, and social living spaces.

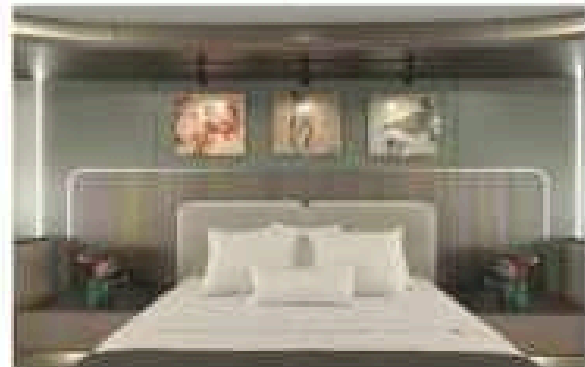

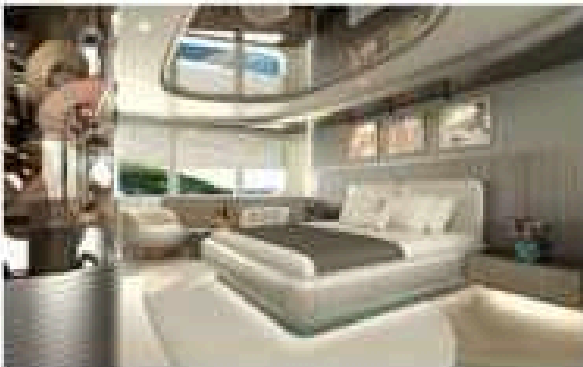

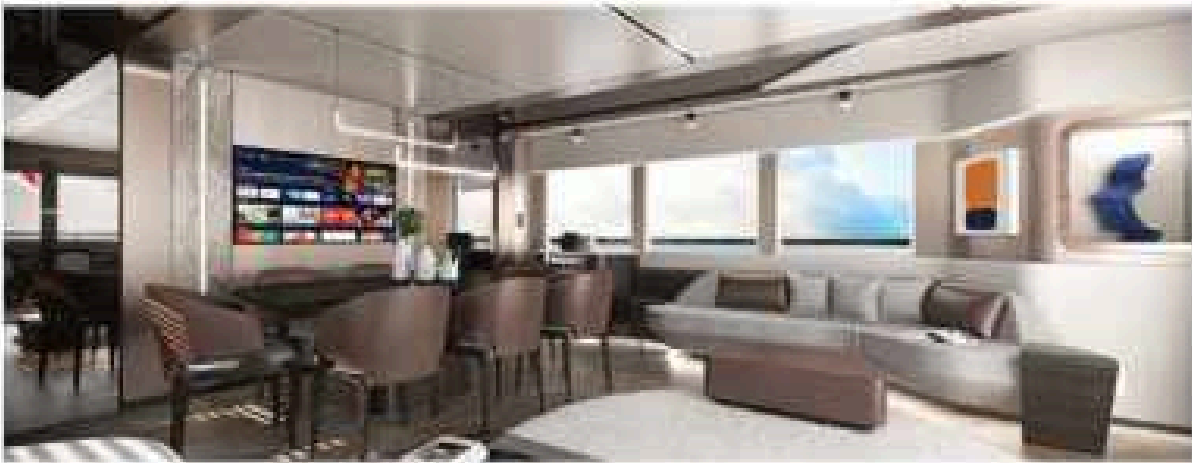

Strengthens Its Position in the Explorer Segment

KANDO 85

A&A Yachts is taking its place in the explorer yacht segment a step further with the Kando 85. Built at the shipyard in Antalya, the model combines long-range capability with a high level of onboard comfort, while strongly reflecting the brand's vision for transoceanic cruising. Preparations are ongoing ahead of the scheduled launch and delivery in early April 2026.

As the latest representative of the shipyard's long-range explorer series, the Kando 85 stands out as a project that continues the brand's approach to building steel-hulled yachts designed for ocean cruising performance.

Constructed with a steel hull and an aluminum superstructure, the 26-meter Kando 85 offers a range of approximately 6,400 nautical miles at an economic cruising speed of 8 knots. With a volume of 199 GT, the yacht promises a remarkable level of interior living space within its segment, developed with a focus on both durability and comfort for extended voyages.

The yacht features a full-beam master suite on the main deck, guest cabins on the lower deck, and spacious social areas throughout. A private portico on the foredeck, along with the flybridge living spaces, enhances outdoor usability. The project's design and engineering processes were carried out entirely in-house by the shipyard.

AvA Yachts

Following delivery, the Kando 85 is scheduled to make its international debut at the Cannes Yachting Festival and the Monaco Yacht Show in 2026.

According to AvA Yachts founder Atilla Kijçükdiker, the Kando 85 reflects the brand's explorer yacht philosophy, centered on long range, robust construction, and generous interior volume.

With this new delivery, AvA Yachts continues to strengthen its position in the explorer yacht segment, appealing to owners worldwide who seek both long-range cruising capability and high onboard living comfort.

Bosphorus Boat Show

A Strategic Momentum for the Mediterranean Basin

At a time when the global maritime industry is navigating economic fluctuations, the Bosphorus Boat Show held in Istanbul emerged as an important meeting point highlighting the dynamism of the regional market and the resilience of the sector. Hosted at the Istanbul Expo Center for eight days, the event welcomed 40,000 visitors and strengthened its position as one of the region's most prominent indoor boat shows in terms of scale and participation.

With more than 500 boats on display from 5-meter tenders to 30-meter superyachts, the exhibition brought together a wide spectrum of production and design within the marine industry under one roof. The price range, varying from €4,000 to €4.4 million, demonstrated that the show caters not only to the high-end yacht segment but also to a multi-layered market structure addressing production capacities at different scales. This broad distribution of segments highlights the active role of Turkish manufacturers in both entry-level boats and larger yacht categories.

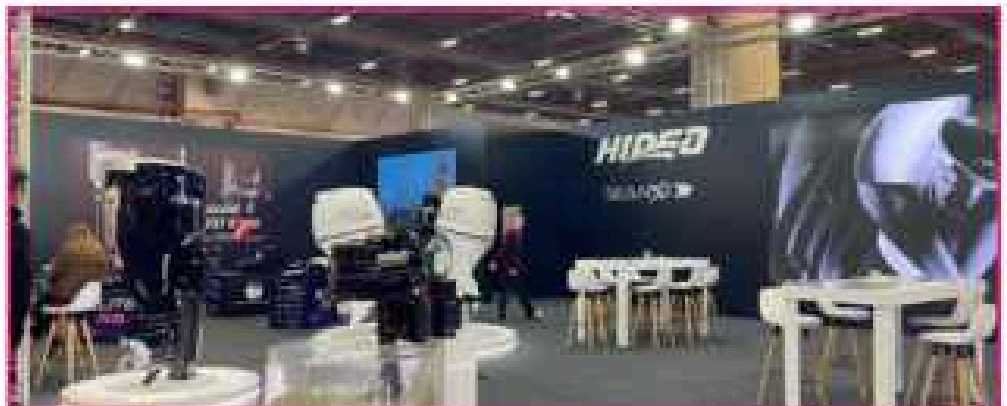

A Platform Driving Sectoral Dynamism

For the Yacht and Boat Industry Association (YATED), which played a key role in organizing the event, the show served not only as a showcase for new models but also as a platform where industry professionals could establish commercial contacts and develop collaborations.

YATED Chairman Murat Bekiroğlu noted that despite current global economic conditions and rising cost pressures, the event generated significant momentum for the sector:

"The Bosphorus Boat Show has evolved beyond the identity of a traditional exhibition and has become an important platform that brings together industry professionals. The growing interest of international investors in our domestic design and engineering capabilities demonstrates that the Turkish yacht industry is becoming increasingly visible on the global stage."

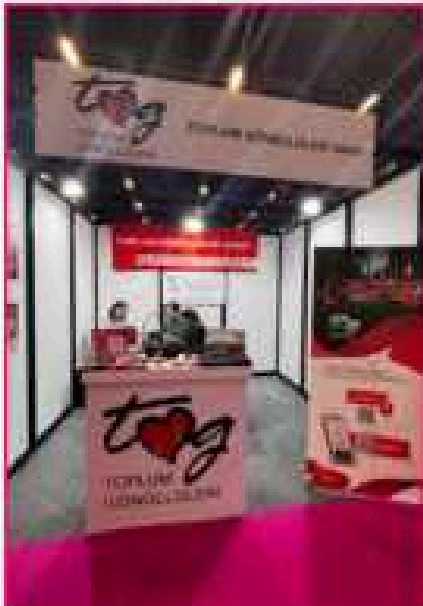

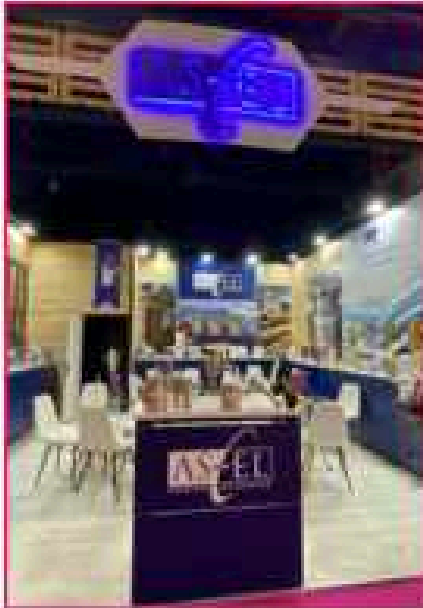

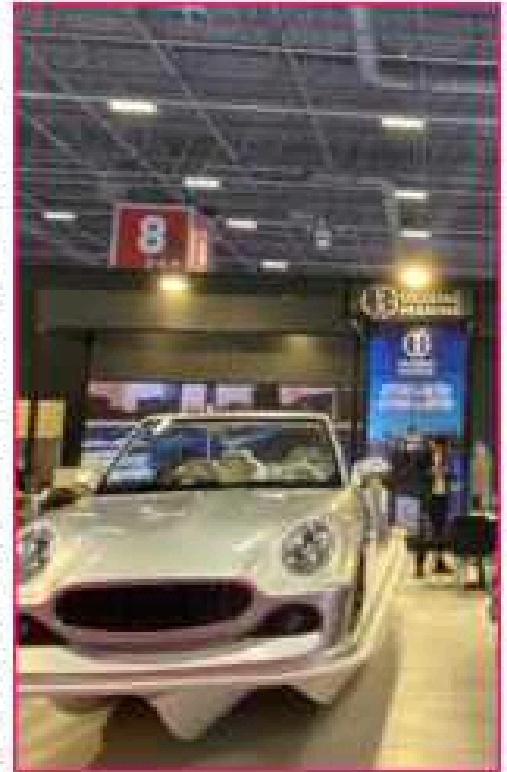

A Regional Meeting Point

During the show, 15 different maritime events and an international panel held for the first time highlighted that the organization also serves as a platform for knowledge exchange and sectoral discussions in addition to its commercial dimension.

Due to its geographical location, Istanbul stands out as a strategic hub connecting the Black Sea, Eastern Mediterranean, and Balkan markets. In this context, the Bosphorus Boat Show goes beyond being an event aimed solely at the Turkish domestic market, attracting attention as a gathering point that brings together various stakeholders of the regional maritime ecosystem.

As the industry moves into upcoming seasons, the picture presented by the show indicates that Türkiye's production capacity and the maritime industry's presence across different segments are becoming increasingly visible on the international stage. In this respect, the Bosphorus Boat Show continues to serve as an important indicator for observing the development of the regional market.

MARCA Yacht & TendR Yachts

Announce Dubai Distribution at Bosphorus Boat Show

TendR Yachts, headquartered in the Netherlands, and MARCA Marine's new brand MARCA Yacht, based in Istanbul and Dubai, signed a strategic distribution agreement today for the United Arab Emirates market with the scope of the Bosphorus Boat Show.

The announcement attracted the attention of industry professionals and yacht enthusiasts throughout the exhibition. With this significant collaboration, TendR Yachts and MARCA Marine will jointly offer yacht models known in Europe and the Mediterranean to the United Arab Emirates market under an official distribution framework.

The announcement made at the Bosphorus Boat Show stood out as a development that contributes to the increase of global collaborations in the maritime industry and enhances the visibility of brands in international markets.

Düsseldorf

The Season's First Gathering:
Taking the Pulse of the Market
at boot Düsseldorf 2026

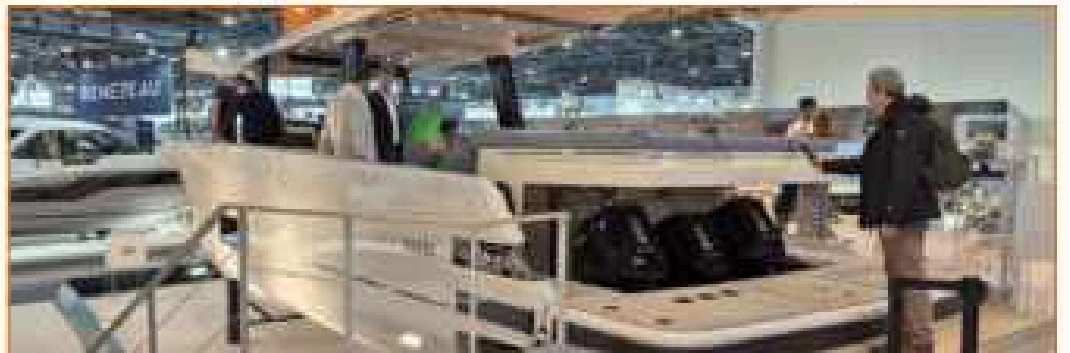

As the first major event of the year for the global yachting industry, boot Düsseldorf 2026 continues to serve as a key indicator setting the tone for the new season. As Yot Haber Türkiye, we took our place at this first international stop of the year, meeting with Turkish participants throughout the show, closely monitoring the pulse of the industry, and gathering insights from a wide range of stakeholders—from manufacturers to brokers.

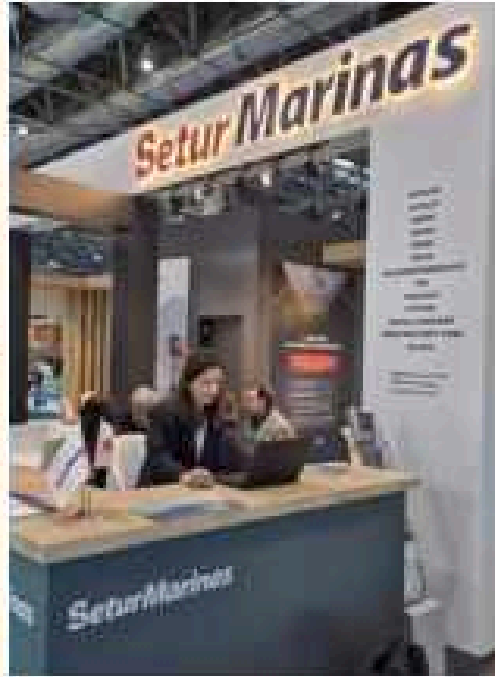

Held between January 17–25, the exhibition brought together more than 200,000 visitors and industry professionals from over 110 countries in Düsseldorf. Around 1,500 companies and brands showcased their latest models, equipment, and services, securing their presence at one of the world's largest yacht and water sports exhibitions.

The presence of Turkish participants was particularly notable across the exhibition halls. Shipyard, equipment manufacturers, and service providers from Türkiye actively leveraged the show to strengthen their connections within the European market. In our conversations with Turkish companies, it became evident that export-oriented brands are increasingly intensifying their efforts to expand distribution networks across Europe.

A Cautious Yet Lively Start

Global economic fluctuations over the past two years have led to a certain slowdown in order flow. However, the atmosphere in Düsseldorf suggests that the industry is moving toward cautious optimism.

Conversations throughout the show frequently highlighted that demand in the European market has not disappeared but rather evolved into a more selective and planned purchasing behaviour.

This reinforces once again that the exhibition is not merely a showcase, but also a strategic platform where business relationships are formed and shaped.

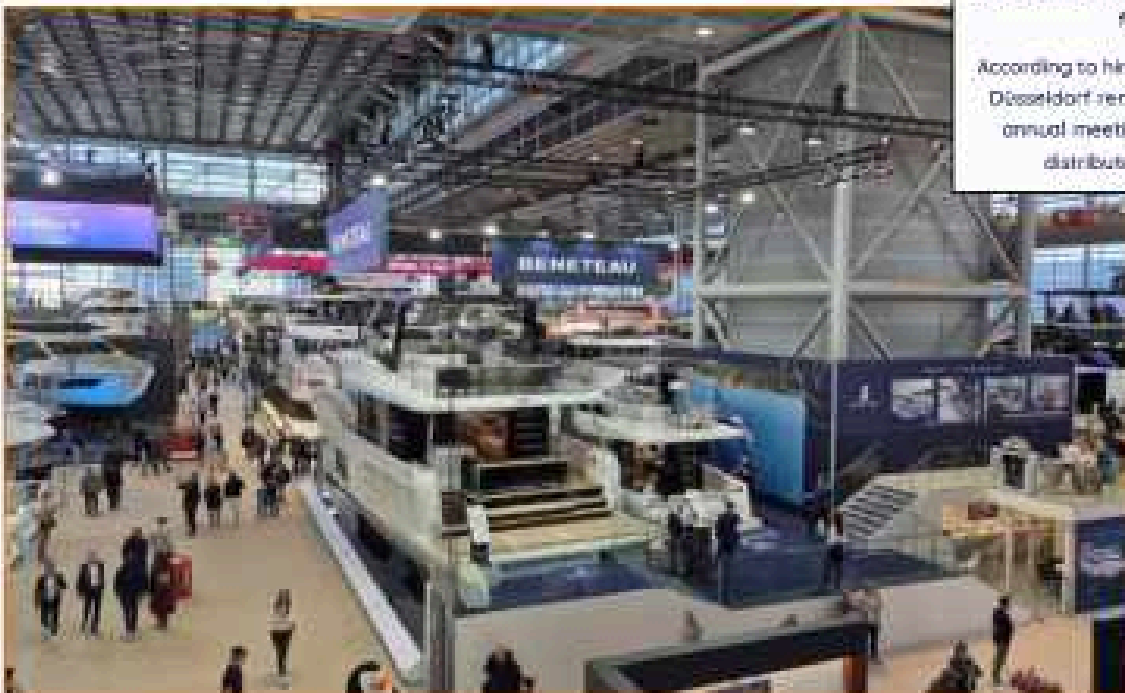

A Strong Message from the Organizer

Petros Michellidakis, Director of the organizing body, shared a similar perspective. In his post-show statement, he emphasized the strong participation and noted:

"We were excellently positioned in the sailing boat and yacht sector this year. Almost all the global players were on board with their boat premieres. In addition, we were able to attract innovative new manufacturers, with many boats being presented for the first time here in Düsseldorf."

Michellidakis also underlined that the event is more than just a product exhibition, stating that Boot Düsseldorf continues to serve as a dialogue platform and a global meeting point for the industry.

According to him, despite ongoing challenges, Düsseldorf remains one of the most critical annual meeting hubs for manufacturers, distributors, and investors alike.

Key Highlights of the Show

This year's edition stood out particularly for new boat launches and model premieres. Numerous world and European premieres took place, drawing strong attention to both sailing and motor yacht segments.

In particular, the mid-size and large motor yacht segments showcased intense competition, with manufacturers focusing on new design approaches, performance-oriented hull structures, and advanced onboard technologies.

Additionally, sections dedicated to charter, marinas, and marine tourism destinations attracted significant visitor interest.

The wide range of charter and holiday options on display reflected the continued momentum in the marine tourism sector.

Overall Assessment

While it may be too early to declare that the industry has entered a phase of rapid growth, the 2026 edition delivers a clear message: the yachting industry is adapting to new economic realities and moving toward a more balanced and sustainable growth model.

And as every year, the first signals of this transformation once again emerged in Düsseldorf.

Türkiye's Elite Charter Fleet Gathers in Marmaris

7th TYBA Yacht Charter Show

Set against Marmaris' distinctive coastline, Türkiye's most distinguished yachts in the commercial charter market are preparing to open the upcoming spring season at a high standard. Organized through the strategic partnership of TYBA (Yacht Operators, Investors, Brokers and Agents Association) and ED Fuarçılık, the 7th TYBA Yacht Charter Show will welcome industry professionals at Marmaris Muttas Marina between May 7-11, 2026.

A Half-Century of Uninterrupted Tradition

Marmaris is not merely a stop in the charter world; it is a long-established meeting point with nearly fifty years of heritage. First initiated in 1979 under the vision of the Anderson family, the event today stands among the oldest, continuously held charter organizations on a global scale. Following the renowned Antigua Charter Yacht Show, it is widely regarded as the second oldest charter event still active worldwide-positioning Marmaris as a privileged destination within the international charter calendar.

This historical depth elevates the event beyond a showcase, transforming it into a platform that reflects Türkiye's maritime institutional memory and its credibility within the global charter market. In recognition of this legacy, Katerina Anderson-representing the Anderson family-will attend as a guest of honour, adding a special dimension to the Marmaris gathering.

A Curated Selection & Professional Networking

Throughout the five-day program, set against the historic silhouette of Marmaris Castle, a carefully curated selection of Türkiye's finest commercial charter yachts will be presented to professional brokers.

The event brings together Türkiye's commercial yacht fleet with the global charter community, while also showcasing the dynamism of the Eastern Mediterranean's charter operations.

Participants will have the opportunity to evaluate yachts' technical capabilities on-site, gain first-hand insight into crew expertise, and explore emerging market opportunities. At the same time, the show offers a highly productive networking environment where strong professional relationships with international industry players can be established.

Beyond marina visits, Marmaris' unique atmosphere and local gastronomy stops provide participants with a direct experience of the region's lifestyle.

Privileged Access for the Global Delegation

To enhance the event's international accessibility, the official airline partner Turkish Airlines offers exclusive flight advantages for registered delegates. This initiative aims to further facilitate access for global charter professionals attending the Marmaris gathering.

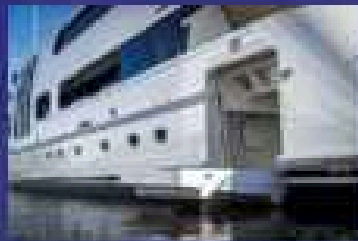

Registration processes, the updated yacht list, and the professional participation guide for the 7th TYBA Yacht Charter Show are now available via the event's official online platform. Industry professionals and global brokers can complete their registrations through the same channel.
